

CATALOGUE OF LDE FLARES (JANUARY 1969 - MARCH 1986)

A. Antalová

Astronomical Institute, Slovak Academy of Sciences,
059 60 Tatranská Lomnica, Czechoslovakia

Received 21 September 1986

ABSTRACT. The catalogue of LDE flares contains data on 646 flares observed in the 20th and on 1029 flares observed in the 21st cycle of solar activity. LDE flares constitute an important subgroup of two-ribbon flares. They are characterized by a strong and long-lasting process of magnetic field reconnection, they produced accelerated protons which propagate into interplanetary space and generate SID's by enhanced shortwave emission.

КАТАЛОГ ВСПЫШЕК С МЕДЛЕННЫМ СПАДОМ МЯГКОГО РЕНТГЕНОВСКОГО ИЗЛУЧЕНИЯ (ЯНВАРЬ 1969 - МАРТ 1986). В каталоге ЛДЭ вспышек приводятся наблюдательные данные для 646 вспышек возникших в 20 - ом цикле (с 1969 года) и для 1029 вспышек, возникших в 21 - ом цикле солнечной активности. ЛДЭ вспышки являются весьма значительной субгруппой двухленточных вспышек. ЛДЭ вспышки выделяются мощным и долгодлительным процессом пересоединения магнитного поля, генерируют ускоренные протоны, которые направлены в межпланетарное пространство и с повышением коротковолнового излучения этих вспышек связан эффект SID.

KATALÓG LDE ERUPCIÍ (JANUÁR 1969 - MAREC 1986). Katalóg LDE erupcií obsahuje pozorovacie údaje o 646 erupciách pozorovaných v 20-tom a o 1029 erupciách pozorovaných v 21-vom cykli slnečnej aktivity. LDE erupcie tvoria významnú podskupinu dvojpruhových erupcií. Vyznačujú sa silným a dlhotrvajúcim procesom rekoneksie magnetického pola, produkujú urýchlené protóny, ktoré smerujú do medziplanetárneho priestoru a zvýšenou krátkovlnou emisiou vyvolávajú SID.

1. INTRODUCTION

Flares with a slow and smooth decrease of intensity of soft X-rays (SXR) form a special subgroup of two-ribbon flares. They are briefly referred to as LDE flare (Long Duration Event). Their gradual phase lasts several hours (Kahler, 1977). Several authors have described LDE flares which have been analysed from a number of viewpoints (Kreplin et al., 1962; Tousey and Koomen, 1972; Sheeley et al., 1975; Krall et al., 1980; Antalová and Ogir, 1984; Ogir and Antalová, 1986; Hanaoka et al., 1986), but a definitive explanation of their essence has still not been presented. LDE flares, as opposed to the usual two-ribbon flares, are characterized by the formation of durable systems of post-flare magnetic loops. These arch above the neutral line of the longitudinal component of the magnetic field from the chromosphere to the corona. The current scenario of LDE flares (Priest, 1983, 1986) assume that the post-flare loops are generated as a result of field-line reconnection of the magnetic field which opened in some way at the beginning of the flare (model of Kopp and Pneuman, 1976). The magnetic field is probably opened up by a rising or lifting filament in some events (Švestka, 1976; Pneuman, 1979; Priest, 1983; Pneuman, 1984).

There are other observations of LDE flares in which filament remains in its pre-flare situation (De Jager and Švestka, 1985), or it does not occur in the region at all (Ogir and Antalová, 1986) which throws some doubt on the validity of the mechanism of field opening by the filament.

The study of LDE flares is important particularly from the following points of view:

a) The long-lasting post-flare loops, which form the basic structure of the gradual phase of LDE flares, are indicators of an intensive process of magnetic field reconnection. The reconnection schedule, localization of the post-flare loops in just a particular part of the flare ribbons, the energy pattern of the gradual phase and the homology of the LDE flares represent but a subjective selection of unsolved reconnection problems.

b) LDE flares are a source of accelerated protons. As opposed to gamma flares in which accelerated protons are directed towards the Sun's surface (Hudson, 1985), during LDE flares protons escape into interplanetary space. This follows from the observations of protons in the neighbourhood of the Earth after 53 parent LDE flares (Antalová, 1986). According to the old terminology, LDE flares are usually identified with proton flares. It is nearly certain that LDE flares are not the only type of flares which produces a recordable amount of protons in interplanetary space. The category of proton flares is broader and LDE flares are but one type which belongs to them. LDE flares are important with regard to forecasting proton showers.

c) LDE flares are a source of enhanced EUV and SXR emissions which last several hours. Practically all M-class flares (with an SXR flux of 10^{-5} to 10^{-4} Wm^{-2}) generates SID's (Sudden Ionospheric Disturbance).

The purpose of this study is to compile a complete list of LDE flares, ba-

sed on SXR observations published in Solar Geophysical Data (SGD) from 1969 to 1986. From the occurrence of LDE flares in the 20th and 21st activity cycles it should be possible to derive the conditions under which reconnection of the magnetic field takes place from a broader global viewpoint of solar activity.

2. SELECTION OF LDE FLARES

A homogeneous selection of LDE flares can only be made on the basis of continual monitoring of solar soft X-rays (1 - 8 Å) by satellites. A typical smooth decrease of SXR intensity in time will enable a homogeneous selection of LDE flares. Patrol H-alpha observations of flares are not suitable for this purpose, because the selection criteria are not sufficiently well known. The fact that the flare is a two-ribbon flare is not a sufficient condition. Not all two-ribbon flares have long-lasting post-flare loops.

On the other hand, the SXR observations made by patrol satellites of the Explorer, SMS, GOES and Prognoz type are integral and they monitor SXR from the solar disk as a whole. The detail spatial identification of LDE flares and of their magnetic structures can be effected by means of H-alpha observations, by means of the time coincidence of both events.

The LDE flares for the catalogue were chosen on the basis of daily observations of SXR by instruments installed on the following satellites:

January 1969 - April 1974

Solrad 9 - Explorer 37. Observations published in Solar Geophysical Data Nos 299 - 365, Part II.

July 1974 - December 1976

Synchronous Meteorological Satellite (SMS-1 and SMS-2), GOES-1 (Geostationary Operational Environmental Satellite). The observations of SXR were published by Donnelly (1981). The calibration and instrumental equipment of the GOES-type satellites (Unzicker and Donnelly, 1974; Donnelly et al., 1977; Bouwer et al., 1982) enable the temperature variations in post-flare loops to be calculated (Thomas et al., 1985; Schmahl et al., 1986).

January 1977 - December 1980

Synchronous Meteorological Satellite SMS-2 and GOES-1, GOES-2 and GOES-3. Observations published by Donnelly and Bouwer (1981).

September 1978 - May 1983

SMS and GOES-2 whose observations were published in SGD 416/part II to 471/II. From May 16, 1983, GOES-2 satellite data are not longer available.

October 1983 - March 1986

From October 1982 solar soft X-ray radiation data are available from satellite GOES-5.

3. CATALOGUE OF LDE FLARES (TABS 1 AND 2)

A total of 646 LDE flares were selected in the years 1969 - 1976 (during the decreasing part of the 20th solar cycle) and these are given in Tab. 1.

Table 2 gives the data for 1029 LDE flares observed during solar activity cycle 21.

Tables 1 and 2 are arranged as follows:

- Column 1: Current catalogue number of LDE flare.
Column 2: Date (month, day) of LDE flare.
Column 3: The type of observation (Ha - H-alpha, SXR - Soft X-ray).
Column 4: Beginning of LDE flare in UT.
Column 5: Duration of event in hours.
Column 6: Number of parent active region of LDE flare according to SGD.
Column 7: Heliocentric position of LDE flare, the second line giving the heliographic longitude of LDE flare.
Column 8: Importance of LDE flare in H-alpha and the second line giving SXR class according to the maximum radiation value in the wavelength interval of 1 to 8 Å : $10^{-6} \leq C \leq 10^{-5} \text{ Wm}^{-2}$; $10^{-5} \leq M \leq 10^{-4} \text{ Wm}^{-2}$; $10^{-4} \leq X$.
Column 9: Sudden Ionospheric Disturbance (SID). SID importance is expressed on a scale of 1 (weakest) to 3+ (most intensive events). The second number is the wide spread index which ranges from 1 to 5 (which indicates at how many observatories the event was recorded, from 1 to all).
Column 10: Reference.

The statistical analysis of LDE flares listed in Tabs 1 and 2 will be published by author in the Bulletin of the Astronomical Institutes of Czechoslovakia 38 (1987).

Regional distribution of LDE flares is given in Tabs. 3 and 4.

ACKNOWLEDGEMENT

The author wishes to thank Mr. R. Mačura and Mr. P. Bendík for their help in producing the tables.
