Received: May 27, 1997

Abstract. The heliographic longitudinal distribution of the daily soft X-ray flare index values is given for 1977–1978 years (Table 1). The soft X-ray flare index was determined from the daily continuous SMS-GOES profile of solar soft X-ray flux (0.1–0.8 nm), as published in Solar Geophysical Data. The left (right) columns of Table 1 comprise the 1977 (1978) daily data. The Eastern (E), Central (C) and Western (W) LDE-type flare indices, as well as a daily flare index of the impulsive (I) flares were published for the decreasing part of the 20-th solar cycle, as well as for the onset part of the 21-st solar cycle (from January 1, 1969 to December 31, 1978).

Key words: the Sun - flares

1. Spatial Distribution of LDE-type flares (description of the table)

The 1969–1976 daily soft X-ray (0.1–0.8 nm) flare index has already been published in the Contributions of the Astronomical Observatory Skalnaté Pleso (26 and 27 volumes). This paper gives the 1977–1978 continuation of the daily flare indices (FIs). They were constructed by weighing the SXR flare-classes (in units of 10^{-6} W/m^2) regardless the duration of a flare (Antalová, 1996) so, for example, a C6.7, (M5.1; X9.3) soft X-ray flare index bears the value equal 7 (51; 930). The LDE-type flare FI values are given into E-C-W heliographic belts and their sum represents the global value for the all solar disk (D). The left (right) columns of Table 1 comprise the 1977 (1978) daily soft X-ray flare index, which was computed separately for: (i) the LDE-type flare (duration in soft X-ray ≥ 2 hours), which is identical with the flare-type known as a 'long decay' (Kahler, 1977) and related to an eruptive flare definition (Švestka, 1995) and Coronal Mass ejections (Webb et al. 1997); (ii) the impulsive-type flare (lasting in SXR less than 2 hours). The distribution of FI into E, C, and W belts is given only for LDE-type flares. The following flare subsets are given in Table 1: E - the daily flare index for LDE-type flares located from $E90^\circ$ to $E45^\circ$ on the solar disk;

Table 1. The 1977 (left) and 1978 (right) daily values of the soft X-ray (0.1–0.8 nm) flare indices. E-C-W columns give the FI distribution of LDE-type flares located into Eastern, Central and Western solar belts.

C - the FI for LDE-type flares located from E44° to W44° on the Sun;
W - the same as above but for LDE-type flares located from W45° to W90°;
D - the soft X-ray flare index of all LDE-type flares observed in the given day;
I - the daily flare index of the impulsive-type flares;
T - the daily flare index of all soft X-ray flares (total, T = D + I).
