Received: February 15, 2001

Abstract. The paper presents the results of position photographing of comets carried out at the Skalnaté Pleso Observatory in the year 1994. A total of 58 observations of 7 comets are given.

Key words: comets – astrometry

1. Introduction

The presented paper is a continuation of the previous papers which gave the results of positional observations of comets made at the Skalnaté Pleso Observatory (the last paper of this series: Svoreň; 2000) and contains positional comet observations made in the year 1994.

The observations were made with a 0.3-m f/5 Zeiss astrograph. The reduction constants of the Skalnaté Pleso astrograph are as follows:

$\lambda = -\ 1^h\ 20^m\ 58.70^s$,
$\varphi = +49^\circ\ 11'\ 20.0''$,
h = 1783 m m.s.l.,
$\rho = 0.99836$ of the equatorial radius of the Earth.

The comets were photographed on ORWO plates with ZU 21 emulsion, dimensions 9x12 cm, which roughly correspondens to field of 3°x 4°. The reference stars required to compute positions using Schlesinger's method of dependences, from two independent triangles were selected from the Star Catalog of the Smithsonian Astrophysical Observatory (1966). The differences between independent determination of the equatorial coordinates, given for each poosition, provide some information about the accuracy of the measuring (but not about the accuracy of the object position). The rectangular coordinates of the reference stars and the comets were measured with the aid of instrument for measuring coordinates produced by Zeiss (Ascoremat E-60).

A total of 58 accurate positions of 7 comets, arranged according to the new system designation, are given. The list of collaborators is given, together with their share in photographing, measuring and reducing the positions.

Contrib. Astron. Obs. Skalnaté Pleso **31**, (2001), 43 – 50.

2. Conversion from eqn. B1950.0 to eqn. J2000.0

The reference stars were selected from the Smithsonian Astrophysical Observatory Star Catalog(1966). The positions were measured in B1950.0 system and then converted to J2000.0 following the formulas published by System Transition Committee of the IAU Commission 20 (Yeomans, 1990). Conversion from eqn. B1950.0 to eqn. J2000.0 is as follows:

Let α_0 and δ_0 are object's right ascension and declination referred to 1950.0 system. Then the calculated rectangular components of the object's position vector $\mathbf{r_0}$ referred to 1950.0 system are:

$$r_{0x} = cos\alpha_0 \;\; cos\delta_0 \tag{1}$$
$$r_{0y} = sin\alpha_0 \;\; cos\delta_0 \tag{2}$$
$$r_{0z} = sin\delta_0 \tag{3}$$

The astrographic position vector $\mathbf{r_1}$ is formed to remove the effects of elliptical aberration:

$$r_{1x} = r_{0x} - A_x + B\ r_{0x} \tag{4}$$
$$r_{1y} = r_{0y} - A_y + B\ r_{0y} \tag{5}$$
$$r_{1z} = r_{0z} - A_z + B\ r_{0z} \tag{6}$$

where B is a scalar product of the vector transpose to $\mathbf{r_0}$ and the vector $\mathbf{A}$, i.e.

$$B = r_{0x}\ A_x + r_{0y}\ A_y + r_{0z}\ A_z \tag{7}$$

and A_x, A_y, A_z are the rectangular components of the vector $\mathbf{A}$:

$A_x = -1.62557 \times 10^{-6}$
$A_y = -0.31919 \times 10^{-6}$
$A_z = -0.13843 \times 10^{-6}$

If the t is Julian time of the observation, then the Julian centuries from 1950 epoch to the observation time can be calculated as

$$T = (t - 2433282.423)\ /\ 36525 \tag{8}$$

The rectangular components of the object's position vector $\mathbf{r}$ referred to 2000.0 system are:

$$r_x = X_x\ r_{1x} + X_y\ r_{1y} + X_z\ r_{1z} \tag{9}$$
$$r_y = Y_x\ r_{1x} + Y_y\ r_{1y} + Y_z\ r_{1z} \tag{10}$$
$$r_z = Z_x\ r_{1x} + Z_y\ r_{1y} + Z_z\ r_{1z} \tag{11}$$

where $X_x, X_y, ..., Z_z$ are the elements of the rotation matrix (Murray, 1989):

$$X_x = +0.9999256794956877 - 0.0026455262 \times 10^{-6}\ T$$
$$X_y = -0.0111814832204662 - 1.1539918689 \times 10^{-6}\ T$$
$$X_z = -0.0048590038153592 + 2.1111346190 \times 10^{-6}\ T$$
$$Y_x = +0.0111814832391717 + 1.1540628161 \times 10^{-6}\ T$$
$$Y_y = +0.9999374848933135 - 0.0129042997 \times 10^{-6}\ T$$
$$Y_z = -0.0000271625947142 + 0.0236021478 \times 10^{-6}\ T$$
$$Z_x = +0.0048590037723143 - 2.1112979048 \times 10^{-6}\ T$$
$$Z_y = -0.0000271702937440 - 0.0056024448 \times 10^{-6}\ T$$
$$Z_z = +0.9999881946023742 + 0.0102587734 \times 10^{-6}\ T$$

The coordinates α, δ in J2000.0 system are calculated using the expressions:

$$\alpha = arctg\frac{r_y}{r_x} + 90.\ (1 - \frac{r_x}{|r_x|}) \tag{12}$$

$$\delta = arctg\ \frac{r_z}{\sqrt{r_x^2 + r_y^2}} \tag{13}$$

3. Positions of comets

The individual columns of the table contain the following:
N - ordinal number of observation,
Date U.T. - date and time of the middle of the exposure,
$R.A._{2000}$ - right ascension for equinox 2000.0 (in h,m,s),
$Decl._{2000}$ - declination for equinox 2000.0 (in °,′, ″),
T - the exposure time in minutes,
A - the difference between independent determinations of R.A. in arc seconds,
B - the difference between independent determinations of Decl. in arc seconds.
Notes: N. 12 - involved with star, N. 33 and 34 - bad seeing.
