Received: August 31, 2003

**Abstract.** The paper presents results of position photographing of minor planets carried out at the Skalnaté Pleso Observatory in the year 1984. 51 observations of 14 minor planets are given together with a list of reference stars and dependences.

**Key words:** asteroids – astrometry

### 1. Introduction

Papers concerning the results of astrometry observations at the Skalnaté Pleso Observatory were published before. The series was interrupted for 11 years. The last paper on minor planets astrometry contained the observations obtained in the year 1983 (Svoreň, 1996) and results since 1995 up to date have also been published (Neslušan and Svoreň, 1995; and next). The present paper is the first one to bridge the above-mentioned gap and contains the observations made in the year 1984.

The observations were made with a 0.3-m f/5 Zeiss astrograph. The reduction constants of the Skalnaté Pleso astrograph are as follows:

$$\begin{aligned}\lambda &= -1^h 20^m 58.70^s, \\ \varphi &= +49^\circ 11' 20.0'', \\ h &= 1783 \text{ m a.s.l.}, \\ \rho &= 0.99836 \text{ of the equatorial radius of the Earth.}\end{aligned}$$

Asteroids were photographed on ORWO plates with ZU 21 emulsion, dimensions 9x12 cm, which roughly corresponds to a field of  $3^\circ \times 4^\circ$ . Reference stars required to compute positions using Schlesinger's method of dependences, from two independent triangles were selected from the Star Catalog of the Smithsonian Astrophysical Observatory (1966). Differences between independent determination of the equatorial coordinates, given for each position, provide some information about the accuracy of the measuring (but not about the accuracy of the object position). The rectangular coordinates of the reference stars and the minor planets were measured with the aid of instruments for measuring coordinates produced by Zeiss (Koordinatenmessgerät and Ascoremat E-60).

A total of 51 accurate positions of 14 minor planets are given. A list of reference stars and dependences and a list of collaborators are given, together with their share in photographing, measuring and reducing the positions.

## 2. Conversion from eqn. B1950.0 to eqn. J2000.0

The reference stars were selected from the Smithsonian Astrophysical Observatory Star Catalog (1966). The positions were measured in the B1950.0 system and then converted to the J2000.0 employing the formulas published by System Transition Committee of the IAU Commission 20 (Yeomans, 1990). The conversion from eqn. B1950.0 to eqn. J2000.0 is as follows:

Let  $\alpha_0$  and  $\delta_0$  are respectively object's right ascension and declination referred to 1950.0 system. Then the calculated rectangular components of the object's position vector  $\mathbf{r}_0$  referred to the 1950.0 system are:

$$r_{0x} = \cos\alpha_0 \cos\delta_0, \quad (1)$$

$$r_{0y} = \sin\alpha_0 \cos\delta_0, \quad (2)$$

$$r_{0z} = \sin\delta_0. \quad (3)$$

The astrographic position vector  $\mathbf{r}_1$  is formed to remove the effects of elliptical aberration:

$$r_{1x} = r_{0x} - A_x + B r_{0x}, \quad (4)$$

$$r_{1y} = r_{0y} - A_y + B r_{0y}, \quad (5)$$

$$r_{1z} = r_{0z} - A_z + B r_{0z}, \quad (6)$$

where B is a scalar product of the vector transpose to  $\mathbf{r}_0$  and the vector  $\mathbf{A}$ , i.e.

$$B = r_{0x} A_x + r_{0y} A_y + r_{0z} A_z, \quad (7)$$

and  $A_x, A_y, A_z$  are the rectangular components of the vector  $\mathbf{A}$ :

$$A_x = -1.62557 \times 10^{-6},$$

$$A_y = -0.31919 \times 10^{-6},$$

$$A_z = -0.13843 \times 10^{-6}.$$

If  $t$  is the Julian time of the observation, then the Julian centuries from the 1950 epoch to the observation time can be calculated as

$$T = (t - 2433282.423) / 36525. \quad (8)$$

The rectangular components of the object's position vector  $\mathbf{r}$  referred to the 2000.0 system are:

$$r_x = X_x r_{1x} + X_y r_{1y} + X_z r_{1z}, \quad (9)$$

$$r_y = Y_x r_{1x} + Y_y r_{1y} + Y_z r_{1z}, \quad (10)$$

$$r_z = Z_x r_{1x} + Z_y r_{1y} + Z_z r_{1z}, \quad (11)$$

where  $X_x, X_y, \dots, Z_z$  are the elements of the rotation matrix (Murray, 1989):

$$\begin{aligned} X_x &= +0.9999256794956877 - 0.0026455262 \times 10^{-6} T, \\ X_y &= -0.0111814832204662 - 1.1539918689 \times 10^{-6} T, \\ X_z &= -0.0048590038153592 + 2.1111346190 \times 10^{-6} T, \\ Y_x &= +0.0111814832391717 + 1.1540628161 \times 10^{-6} T, \\ Y_y &= +0.9999374848933135 - 0.0129042997 \times 10^{-6} T, \\ Y_z &= -0.0000271625947142 + 0.0236021478 \times 10^{-6} T, \\ Z_x &= +0.0048590037723143 - 2.1112979048 \times 10^{-6} T, \\ Z_y &= -0.0000271702937440 - 0.0056024448 \times 10^{-6} T, \\ Z_z &= +0.9999881946023742 + 0.0102587734 \times 10^{-6} T. \end{aligned}$$

The coordinates  $\alpha, \delta$  in J2000.0 system are calculated using the expressions:

$$\alpha = \arctg \frac{r_y}{r_x} + 90. \left(1 - \frac{r_x}{|r_x|}\right), \quad (12)$$

$$\delta = \arctg \frac{r_z}{\sqrt{r_x^2 + r_y^2}}. \quad (13)$$

### 3. Positions of minor planets

The data have been arranged according to serial numbers of minor planets. The individual columns of the table contain the following:

N - ordinal number of observation,

MP - number of minor planet,

Date U.T. - date and time of the middle of the exposure,

*R.A.*<sub>2000</sub> - right ascension for the equinox 2000.0 (in h,m,s),

*Decl.*<sub>2000</sub> - declination for the equinox 2000.0 (in °, ', '')

A - the difference between independent determinations of R.A. in arc seconds,

B - the difference between independent determinations of Decl. in arc seconds.

N	MP	Date U.T.	<i>R.A.</i> <sub>2000</sub>	<i>Decl.</i> <sub>2000</sub>	A	B

#### 4. Reference stars and dependences

The individual columns of the table contain the following:

N - ordinal number of the observation in agreement with Section 2,  
 Numbers of reference stars and dependences (SAO catalogue of reference stars  
 is used at all the calculations),  
 T - the exposure time in minutes.

N	Numbers of stars and dependences						T
1	111258	.33139	93500	.19090	111287	.47771
