Abstract. The paper presents a list of 387 Geminids selected from the latest version of the IAU MDC database of photographic orbits. The selection was made by a method of indices described in detail in the paper by Svoreň et al. (2000).

1. Introduction

The latest completed version of the IAU Meteor Data Center catalogue of precise photographic orbits (Lindblad et al., 2005) was used for making a selection of the members of the Geminid meteoroid stream. The meteors with heliocentric velocities greater than 48 km s^{-1} were omitted from this analysis in the light of our previous results (Porubčan et al., 1995). Thus the final set of database consisted of 4526 orbits.

The method of indices was used to acquire a basic data set for the Geminids - totally 387 orbits were selected. A detailed description of the method of indices was published elsewhere (Svoreň et al., 2000 and Kaňuchová et al., 2005).

As input data we used 5 orbital elements incorporated in the Southworth-Hawkins D-criterion (1963): q - the perihelion distance, e - the eccentricity, ω - the argument of perihelion, Ω - the longitude of ascending node and i - the inclination of the plane of meteor orbit to the ecliptic. Next our parameters are α - right ascension and δ - declination, the coordinates of the radiant (which belong to the most accurately known parameters) and v_{g} - the geocentric velocity (a significant parameter characteristic for physically related orbits).

In the first step of procedure the relative ratios, approximated by small integers, corresponding to the reciprocal values of the relative errors of considered parameters, were applied as the basic numbers for the division of the parameters. Next, indices to a meteor according to the interval pertinent to its parameters are assigned on the basis of a division of the observed ranges of parameters. Finally, a philosophy of the method says that a grouping of the meteors with the same indices reflects a similarity among the orbits.

The reader can find some more details and the table listing the mean errors and the numbers of intervals of basic division in the article by Svoreň and Kaňuchová (2005).

Table 1. The ranges of parameters for 387 selected Geminids and the mean orbit.

parameter	q	e	ω	Ω	i	α	δ	v_{g}
Lowest value	0.085	0.743	318.1	256.8	12.1	107.4	29.3	24.40
Highest value	0.234	0.981	334.4	263.8	43.2	121.7	35.3	44.20
Mean orbit	0.141	0.894	324.6	261.9	23.6			
	±0.016	±0.023	±1.8	±1.0	±3.2			

The list of selected Geminids is given in Table 3. Only the indentification number, date and time of observation and the above-mentioned 8 parameters are incorporated in Table 3.

There are some meteors, marked with an asterix (*), with orbital parameters slightly different from those of typical Geminids in the list. Their separation (except of meteors 103P1 and 126D8) by the method of indices was ambiguous. And, especially, some meteors have a lower eccentricity and a higher perihelion distance than expected (e.g. 166N2, 161N2, 180N2). We decided to keep them in the list being prepared for the next analysis, because we cannot exclude that they form some extra structure in the Geminid stream. The other possibility is, as they were observed by one station (except of 033T2), that some systematic error has occured.

The reader can obtain all the other data characterizing the selected meteors from the electronics version of the IAU MDC databaze (Lindblad et al., 2005). The identification number simplifies identification of meteors in the database.

Figure 1. Radiants of 387 selected photographic Geminids.
Figure 2. Mean radiants (and root-of-mean-squares of their coordinates) for groups of meteors observed in 1 day intervals. The daily motion of the Geminid radiant is well seen.

2. Statistics of selected Geminids

The selected Geminids cover interval from December 8th to December 15th. Ranges of parameters for 387 Geminids are listed in Table 1 and mean orbit is in the last row. Figure 1 depicts the radiants of 387 Geminids in the equatoreal coordinate system. The daily motion of the mean radiant is well seen in Figure 2; Figures 3 and 4 respectivelly. The relations between the geocentric radiant coordinates α, δ and solar longitude $\lambda_\odot$ were derived by the method of least squares. The parameters of related linear equations (shown in Figures 3 and 4) are in Table 2. Our results are in good agreement with those of Porubčan et al. (2004).

Figure 3. Right ascension of 387 selected Geminids. (Note: $\Omega = \lambda_\odot$.)

Figure 4. Declination of 387 selected Geminids. (Note: $\Omega = \lambda_\odot$.)

**Table 2.** Daily motion of the Geminid's radiant (2000.0) in the standard form; and in the form with coefficients derived by the method of least squares.

α	δ
113.7+0.837($\lambda_\odot$-261.9)	32.4-0.196($\lambda_\odot$-261.9)
-(105.5±17.3)+(0.837±0.066)$\lambda_\odot$	(83.7±8.9)-(0.196±0.034)$\lambda_\odot$

Table 3. Selected Geminids - *IN* - identification number, *d.t.* - date (yymmdd.) and time (.ttttt), *q* - perihelion distance in AU, *e* - eccentricity, ω - argument of perihelion in degrees, Ω - longitude of ascending node and *i* - inclination of the plane of meteor orbit to the ecliptic in degrees, α - right ascension and δ - declination of the radiant in degrees, v_g - geocentric velocity in km per second.
