

Astrometry of minor planets made at the Skalnaté Pleso Observatory in 2010

M. Husárik

*Astronomical Institute of the Slovak Academy of Sciences
059 60 Tatranská Lomnica, The Slovak Republic*

Received: May 16, 2012; Accepted: July 23, 2012

Abstract. The paper presents results of position determinations of minor planets carried out at the Skalnaté Pleso Observatory in 2010. A total of 110 accurate positions of 26 minor planets are given.

Key words: asteroids – astrometry

1. Introduction

The present paper is a continuation of our previous papers which gave the results of positional CCD observations of minor planets obtained at the Skalnaté Pleso Observatory (the last paper of this series being Husárik, 2012) and contains observations made in 2010. Missing observations from 2005 to 2009 will be published one after the other simultaneously with the new obtained positions.

The observations were performed with a 0.61-m f/4.3 reflector and a CCD camera SBIG ST-10XME. We obtained CCD frames using a Johnson-Cousins *R* filter with 3×3 binning and resolution of 1.6 arcsec/px. We applied the standard calibration with dark and flatfield frames with IRAF tools. The positions of minor planets were made using the method of plate constants within the software *Astrometrica* (Raab, 2011). The reference stars were selected from UCAC-3 star catalogue.

A total of 110 accurate positions of 26 minor planets are given, as well as a list of collaborators.

2. Positions of minor planets

Table 1 presents the results of positional CCD observations. The data have been arranged according to serial numbers of minor planets.

Table 1. The individual columns of the table contain the following information: N – ordinal number of the observation, Date U.T. – date and time of the middle of the exposure, $R.A._{2000}$ – right ascension for equinox 2000.0 (in h, m, s), $Decl._{2000}$ – declination for equinox 2000.0 (in $^{\circ}$, $'$, $''$), $d\alpha$ – the mean residual in R.A. (in s), $d\delta$ – the mean residual in Decl. (in $''$), Magn. – magnitude of the minor planet in the R filter, $dmag$ – the mean residual in magnitude (in mag), Ref. st. – number of reference stars with a known position and/or magnitude that are used to find the plate constants and photometric calibration of an image.
